Overview

ABSTRACT

Background

Violence Prevention through Urban Upgrading applies a second-generation crime prevention through environmental design, which includes built environment interventions alongside social programmes and community participation initiatives. We assessed the association between the intervention and reported experience of violence in Khayelitsha, one of South Africa's poorest and most violent suburbs.

Method

We conducted a retrospective population-based study using survey data from 3625 geo-located households collected between 2013 and 2015 and mapped alcohol outlets across the study area. Generalized linear models helped estimate and compare self-reported experience of violence adjusting for known confounders, which included area and household deprivation as well as alcohol outlet density.

Findings

Living in close proximity to the upgraded urban infrastructure was associated with a 34% reduced exposure to interpersonal violence after adjusting for confounders. This association was consistent across age and gender. Access to additional social programmes alongside the urban upgrading intervention was not associated with further reduction in risk.

Interpretation

The association between urban-upgrading and reduced exposure to interpersonal violence supports its inclusion among interventions in national and local crime prevention policies to address social and

Africa - Urban upgrading and levels of interpersonal violence in Cape Town, South Africa: the Violence Prevention through Urban Upgrading Programme structural environments.
